Introduction

HemaVision® is a series of CE marked in vitro diagnostic (IVD) tests for fast and sensitive detection of chromosomal translocations associated with leukemia.

The tests are fast 12 hours RT-PCR or 4 hours RT-qPCR screening

tests, capable of analysing for up to 28 translocations and more than 145 clinical relevant translocation breakpoints in a single test.

The starting material for the HemaVision® tests is total RNA extracted from whole blood or bone marrow.
