

Solve more cases faster with data you can trust

When a family has a child with a rare undiagnosed condition or a couple is planning their next chapter, they want assurance that their doctors are considering every peer-reviewed paper and all available evidence in their quest for an answer.

The Human Gene Mutation Database (HGMD®) Professional remains the largest, manually curated resource for finding disease-causing mutations. Founded and maintained by the Institute of Medical Genetics at Cardiff University, the database attempts to collate all known (published) gene lesions responsible for human inherited disease, giving you the best possible chance of reaching a diagnosis.

To date, HGMD Professional contains over 298,000 detailed mutation entries and is used by some of the largest clinical laboratories in the world, including LabCorp and Genomics England.

If you currently use the free version of HGMD, your data is 3 years behind. Power up your NGS variant knowledge with HGMD Professional – leave no stone unturned.
